

BriteCore Engineering Application

The link to this test will expire. We recommend that you save this page locally.

Frontend Hiring Project

Thank you for taking time to do our frontend coding test. It is inspired by a real world problem we faced and includes two parts:

- The coding test
- A few followup questions

Problem

BriteCore's clients use our platform to manage all aspects of their business, including tracking open claims, sending out monthly bills and running annual reports.

As a result, many of our pages are data heavy, and we often use a data table component for display and modifying this information. A data table component is similar to a classic HTML table, but includes other features.

A component to display this data should include the following functionality:

- Displaying data in sortable columns
- Filtering data based on different parameters
- Searching data
- Actions that can be taken on each data item, or applied to all items in the table.
- Effective display and user experience across resolutions

The Coding Test

We would like you to create you own data table component. For this test, download the [data](#) in CSV format to your own computer. This is mock payment data for one of our products. This data includes a description field, which the user will need to be able to customize.

User Stories

As a payment supervisor, I would like to be able to view recent payments logged in the system, so that I can understand all the transactions that have been made.

As a payment supervisor, I would like to be able to edit the descriptions of recent payments easily, so that others can clearly understand why a payment was made.

Requirements

Take as much or as little time as you would like to complete the following requirements:

- Satisfy the user stories outlined above.
- Include tests for your component.
- Feel free to use any frontend framework you'd like. Your solution can also leverage different plugins/tools, but the data table component you create should be your own, and not one provided by a UI pattern library.
- **Bonus Points!:** Use of Vuejs.
- **Bonus Points!:** As you'll be working alongside a design team regularly, an attention to visual polish and UX would be great to see.

Deliverables

One of the major goals in this project is to see how you fill in ambiguities in your own creative way. There is no such thing as a perfect project here, just interpretations of the instructions above, so be creative in your approach.

In order to move your application forward, deliverables will include:

1. A deployed version of your project
2. A GitHub repo containing your project. Your repo must contain these three things:
 - A README that explains your approach and deployment method
 - Your code solution to this test
 - The Javascript file called `quiz.js` that contains what you used to solve the debugging quiz
 - A JSON file called `description.json` that describes you.
3. Adding of these items to your resume's cover letter:
 - The link to the GitHub repo that lists this project
 - The link to the deployed version of your project
4. Uploading of your resume with cover letter in PDF or DOCX format by [clicking this link](#)

Follow-up Questions

Bonus points if your README answers these questions:

1. How long did you spend on the test? Would you do anything differently if you had more time?

2. In what ways would you adapt your component so that it could be used in many different scenarios where a data table is required?
3. What is one CSS property that you recently learned about that helped you solve a problem?

Evaluation

If you'd like to do very well on this project, we'll hand you the categories we utilize to score candidates! They are:

- Business requirements are met or exceeded
- Documentation in clearly written English
- Component is written in a reusable way
- JS contains appropriate models and DOM interactions
- Component styling is well structured and shows understanding of advanced CSS concepts.
- Test coverage is complete and meaningful
- Example can be run in as few steps as possible
- Communication is positive and respectful

Questions

For questions, please use product-hires@britecore.com.

Thank you for your time. We are excited to review your project!
